MAC is researching a new medication for people who are prone to migraine attacks.

Migraine is a very common condition which usually causes a pounding, throbbing headache on one side of the head. It may hurt so much that a person may find it hard doing anything at the time.

The purpose of this study is to test a potential new treatment.

If you take part in the study, you will receive either the study drug or placebo.

This trial will run at our Manchester clinic.
